

A. Material: 30% Glass filled DuPont Zytel super tough Nylon

B.  The hygroscopic properties of Nylon will make this tool suitable for use around ESD sensitive components after a few minutes handling the tool with bare hands. If used with gloves in a clean environment the tools must be dipped in a topical antistatic solution before use in sensitive areas. Topical treatment should be repeated at six month intervals. Without exposure

to moisture or antistatic treatment, Nylon will charge and the charge will not dissipate.

C. Notch for hooking and pulling wires or components.

D. Flat "screwdriver" surface for spudging wire leads down flat on circuit boards.

E. Pointed end for forming wire leads or for use as pointer probe for holding objects for soldering.

Made in America

Prober, Soldering Tool, Nylon
